Replaying audio recordings from noise nuisance investigations has been made easier with the CA-3055 headphone distribution amplifier. The amplifier enables you to connect up to 8 sets of headphones for high quality playback of audio. The system is supplied with closed cup headphones to reduce the impact of background noise from your office when reviewing measurements. This helps you to focus on the recordings collected.

### Calibrated Playback of Audio

With the internal calibration tone which can be made on the Norsonic 140 analyser; headphones can be calibrated using the Grac 434A artificial ear. This ensures the audio you are listening to is being played back at the correct level.

Big differences can be seen in the playback volume of different PC's, speakers and headphones. This calibrated playback gives you peace of mind that you are listening at the correct level. The Grac 434A is available for hire or purchase from Campbell Associates.

Norsonic 140 Analyser

### Playback in Court

Replaying audio recordings in a courtroom situation can be problematic but is invaluable in supporting your noise nuisance cases. It is hard for adjudicating officials to appreciate audio through speakers in large spaces where there will be background noise. Playback through several sets of headphones enables users to concentrate fully on the high quality audio files.
